MS Windows - Install Development Tools

In this guide, we will install the following development tools

- Visual Studio Code
- node
- npm
- tsc

Versions

This lecture has been tested with the following software versions:

- npm 8.15
- node 16.17.0
- tsc 4.7.4
- React 18.2.0
- Spring Boot 2.7.3

Install Visual Studio Code

Visual Studio Code is a general-purpose IDE that support many programming languages. Visual Studio Code has built-in support for TypeScript.

1. In a web browser, visit https://code.visualstudio.com/
2. Follow the link to download Visual Studio Code for MS Windows
3. Run the Installer
4. Follow the steps in the Installer

Install Node

Node is the runtime environment for executing JavaScript code from the command line. By using Node, you can create any type of application using JavaScript, including server-side / backend applications.

In this course, we'll use Node to run applications that we develop using TypeScript and React.

Note: This course has been tested with Node 16.17.0. We will install this version.

1. In your web browser, visit https://nodejs.org/download/release/v16.17.0/
2. Select the **Windows Installer (.msi)** for your system (32-bit or 64-bit)
3. Run the Installer
4. Follow the steps in the Installer
5. Open a **Command Prompt** window to verify the node installation

6. In the **Command Prompt** window, type the following command:

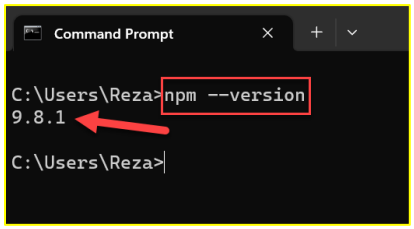

```
node --version
```

- If the installation is successful, you will see the version number. You can also use the following link to install Node.js: https://nodejs.org/en/download/prebuilt-installer

Note: The Node installation also includes npm (Node Package Manager).

- Verify npm is installed

```
npm --version
```

7. If the installation is successful, you will see the version number.

   Note: Node will have a different number than npm. This is similar to a different Java JDK version number compared to the Maven version number.

   In this example, node is similar to the Java JDK. And npm is similar to Maven.

Install tsc

tsc is the TypeScript compiler. We use tsc to compile TypeScript code into JavaScript code. We can install the TypeScript compiler using the Node Package Manager (npm)

Note: We will install this version of TypeScript 4.7

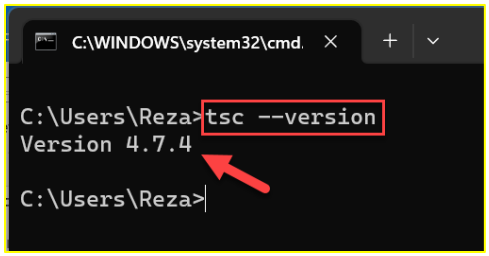

In your **Command Prompt** window, enter the following command

```
npm install --location=global typescript@4.7.4
```

- The "`--location=global`" installs this as a global package. The TypeScript compiler will be available to all directories for this user.

- You can verify the installation

```
tsc -version
```

2. If the installation is successful, you will see the version number.

That's it! You have successfully installed the development tools: Visual Studio Code, Node, npm, and tsc.

Troubleshooting

Permissions Issue with tsc

If you get the following error when executing tsc command using PowerShell:

```
tsc : File C:\Users\johndoe\AppData\Roaming\npm\tsc.ps1 cannot be loaded because
running scripts is disabled on this system. For more information, see
about_Execution_Policies at https:/go.microsoft.com/fwlink/?LinkID=135170.

At line:1 char:1
+ tsc sample-datatypes.ts
+ ~~~
    + CategoryInfo: SecurityError: (:) [], PSSecurityException
                + FullyQualifiedErrorId : UnauthorizedAccess
```

You can resolve this issue with the following steps:

1. Run Visual Studio Code as **Administrator**
2. In the Terminal Window of Visual Studio Code, run `Set-ExecutionPolicy RemoteSigned` on PowerShell.

TypeScript: 'tsc' is not recognized as an internal or external command

If you get the following error when executing tsc command:

```
Typescript: 'tsc' is not recognized as an internal or external command
```

You can resolve this issue with the following:

Add the npm installation folder to your "user variables" AND "environment variables"
